I've been working through this book for a while now, and overall the material is presented in a decent format. For the most part you can pick the topic to work on (ie. Menus, Dialog boxes, etc) and focus on that chapter to learn it. For someone like myself who needs a point solution (very specific app with very narrow GUI requirements) this works well. However that said, one thing that is driving me nuts in this book are the bug-ridden examples. I've been through quite a few chapters

now, and I've come to the expectation that its not a question of -if- a given example has a bug, but where it is located (since it almost certainly has one or more). To give an example I just read over the Modeless dialog example in chapter 11. It starts off having you throw down a dialog and a bunch of controls, without exactly telling you what IDs to give them (after a while you get used to this, because the author does this a lot). Its important because by the time you get to step 7 in the example you realize that the ellipsis button should have an ID of IDC_FILEOPEN if you want your function call to line up with the demo (again not such a problem since you can change the IDs at anytime - but I'm just getting started). At step 10 you get to enter in a global function (huh? what the heck happened to the class?). Moving on - Step 12 has you adding in member variables to a class which won't exist until step 13. Yeah good job there. Step 19 has an erroneous structure definition. And to top it off, steps 21 and 23 have you add message handler functions without actually telling you how to map them in the message map. Whew! and this is just one example program. Typed in exactly as the steps in the book describe, this example compiled with something like 20+ errors.
